                                                   CC molecular weight markers, food supplements, and in antibody production.

CC The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and CC primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or CR NA and in gene therapy. Polypeptides of the invention can be used to carget drugs to a tumour, in assays to determine biological activity, to CC raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. CC polypeptides of the invention may also be useful in treating platelet CC disorders, stem cell disorders, regenerating bone, cartilage, tendon, CC ligament and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anaemia, and contraceptive, treating osteoporosis and osteoarthritis, anaemia, CC alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral CC scartilammatory diseases, nervous system diseases, and infection.

The processor and infection or from autorimmunity, cancer, allergy, asthma, and infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberran
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as

                                                                                                                                                                                                                                 The present invention provides the protein and coding sequences for the variable regions of human monoclonal antibodies which are immunoreactive with human immunodeficiency virus-1 (HIV-1) envelope glycoprotein gp120. These can be used in diagnosis and therapy of HIV-1 infection.

Detecting analyte in human sample containing human antibodies to nonhuman-antibodies, involves contacting sample with human which binds to antibodies from nonhuman species and detecting binding antibody binding

Example 22; Page 94; 135pp; English.

CC detecting an analyte in a human sample containing human anti-mouse antibody (HAMA) (preferably human anti-mouse idiotype antibodies and/or CC heterophilic antibodies). The method can also be used for detecting any CC type of target antigen including bacterial, fungal and viral pathogens CC diardia, Malaria, Leiahmania, Staphylococcus aureus, Pseudomonas CC deruginosa. Human antibodies can be used as detection reagents for CC performing clinical diagnostic tests and for performing other in viro CC detection assays, including for research purposes. (I) can be used in CC qualitative assays designed to indicate the presence of one or more CC target antigens above minimally detectable amounts of antigen in the CC assays for each target antigen in a sample that usually correspond to the sensitivity limitations of the CC assays for each target antigen in a sample tantigens in a sample can also be carried out using (I). AAH41612 to AAH41686, and AAB99361 to AAB99399, represent sequences used in the exemplification of the present antibodies from a nonhuman species. The method involves contacting the sample with a human antibody (I) which specifically binds to antibodies from a nonhuman species and detecting the binding between (I) and the analyte to indicate presence of the analyte. The method is used for The present invention describes a method for detecting an analyte human sample containing human antibodies that specifically bind to Invention ő in a
